

TPE

Default Parameters

• TPE – Procedure

TPE – Procedure

TPE – Step 1 – Sample $f(x)$

Evaluate $f(x)$ at different values of the hyperparameters

How many hyperparameter values should we examine at random?

TPE – Step 2 – Divide observations

Separate observations in 2 groups:

How many observations should we send to group 1 (quantiles usually used, so which q)

$$EI_{y^*}(x) \propto \left(\gamma + \frac{g(x)}{\ell(x)}(1 - \gamma) \right)^{-1}$$

TPE – Step 3 – Estimate distribution of x

Estimate the distributions with
Parzen windows

Window size?

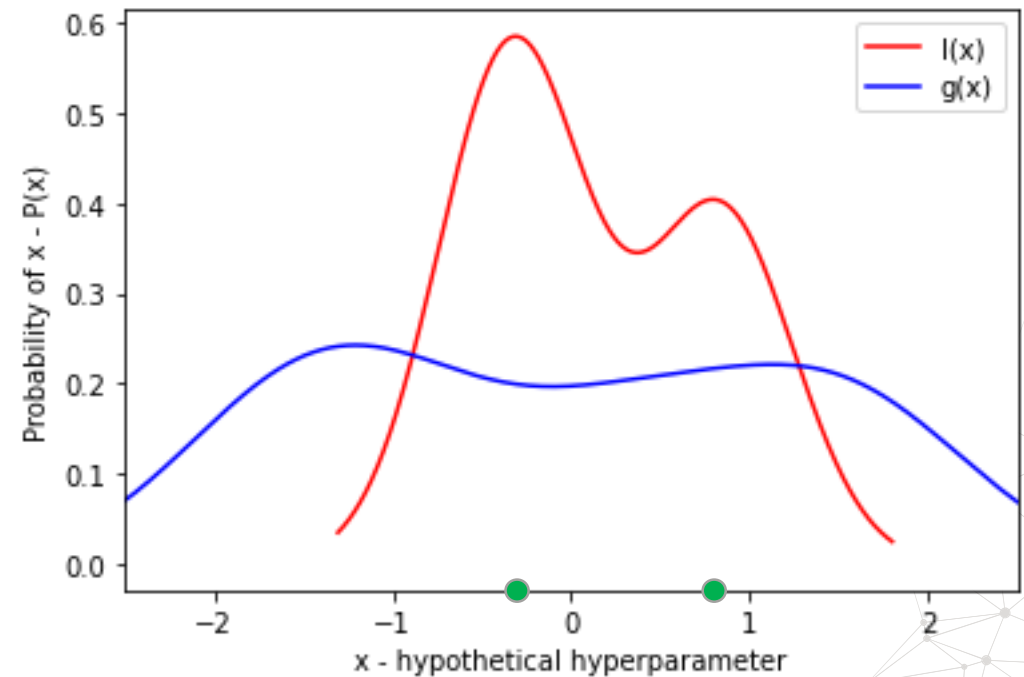

TPE – Step 4 – Estimate EI

Draw samples from $L(x)$

How many?

Determine EI

Find maximum EI

TPE.suggest

```
80
81 _default_prior_weight = 1.0
82
83 # -- suggest best of this many draws on every iteration
84 _default_n_EI_candidates = 24
85
86 # -- gamma * sqrt(n_trials) is fraction of to use as good
87 _default_gamma = 0.25
88
89 _default_n_startup_jobs = 20
90
```

```
829
830 def suggest(
831     new_ids,
832     domain,
833     trials,
834     seed,
835     prior_weight=_default_prior_weight,
836     n_startup_jobs=_default_n_startup_jobs,
837     n_EI_candidates=_default_n_EI_candidates,
838     gamma=_default_gamma,
839     verbose=True,
840 ):
```

TPE.suggest – change parameters

Quick example:

```
from functools import partial
from hyperopt import tpe, fmin

# ...

# this line effectively creates a new function that is the same as tpe.suggest but with some parameter values already set
algo = partial(tpe.suggest, n_startup_jobs=125, n EI candidates=50)

# pass in the new `algo` function that you created instead
best = fmin(fn=ae, space=parameterspace, algo=algo, trials=bayes_trials, max_evals=100)
```
